

# Bostik Flexibond

Bostik Flexibond is an acrylic dispersion for use as a flexible admixture with cement based tile adhesives and or grouts. It can further be used as a primer / sealer for ready mixed tile adhesives and floor underlayment screeds.

The addition of Flexibond to a non-polymer modified adhesive or grout is required where surfaces are prone to very minor movement and vibration or where direct fixing to glazed or other impermeable surfaces is required.

Flexibond should always be added to clean water to obtain the correct dilution.

- **Flexibility – The shear modulus and tensile strength are increased giving greater resistance to minor movements and vibration**
- **Permeability – The cement pores are filled with the polymer, reducing the permeability and therefore reducing any damage by liquid transfer**
- **Improves the deformability of C2 Adhesives to meet the requirements of class S1 according to BS EN 12002**
- **Drying time approximately 60 minutes when diluted as a primer**

Packaging:

2.5 litre plastic jerry
